

A steering handle that writes one constant over W segments keeps exactly the part of the trajectory that is constant over W (Qwen-2.5-1.5B, L14, $k=12$, coverage held at 12 in every cell)

A. Fidelity $R(W, \ell)$: observed, (predicted)
24 cells, zero free parameters, mean $|\text{error}| = 0.013$

B. Control efficiency peaks at $W \approx \ell$
($\star$ = best width; knobs needed for full fidelity = k/ℓ)
